

## Testing summary

We have done couple of testing for our app, both UI testing and Unit testing.

For the UI testing, it's automated, and there is a folder inside the Xcode project called "PetClumpUI Test" and there is a swift file inside of it. It will perform the automated test about our UI such as the main page the button validation, and it will also tap the setting button and enter the setting page which is the user profile page, and input the text fields and so on to ensure the UI is working properly.

There is also a unit test inside the LoginVC.swift file where it performs the unit test for our app.

And we also have performed the scenario testing for each of our user stories, and we have wrote and uploaded the report. It can be accessed by our Github repository ---> 115\_Document----->Release Document----->System and Unit test report.
