Working Prototype Known Problems Report

Product name: Pet Clump
Team name: Clumpers
Revision date: June 1 2018
Revision number: 1.0

List of functions that are not working:

1. The app will not allow user to log out and using a different account to login via Gmail Sign in when using the same machine. (This is unimplemented, not a bug)
2. When in the friend listing page, one-to-one message, and matching view, where it requires a massive of data download, if the network timeout happens, the app will crash.
3. When the pet has not been created yet, if user enter the pet profile page and try to upload the pet picture, the app will crash.
4. When others add you as friend, sometimes user have to enter the friend listing page twice in order to get the friend request message and to accept or reject.
5. After rejecting friend request, the view is not updating.
6. When performing the automated UI test, it sometime display test fails while all the test are passed and succeed . And it's better to run the UI test using one of the existing account to sign in.
